

Partial commit in TortoiseGit

- **Right click** a file you want to partially commit
- Click **Restore after commit** - This immediately creates an internal copy of the file.
- **Double click** the file to edit in **TortoiseGitMerge**

- **Right click** -> **Mark this block** for each change you want to commit now

- **Right click** -> **Leave only marked blocks** to revert the other changes.
As an alternative to these two steps, you can edit the file the way you want.
- **Save** and **Close TortoiseGitMerge**
- **Commit** - this restores the internal copy of the file afterwards.
- The changes you just reverted in TortoiseGitMerge are now restored in your working tree.
